

# Install guide DAKO software

## Prerequisites

- Excel 2002-2007
- Administrator rights at first install, needed to register the add-in (dll, using regsvr32) in excel. Subsequent updates do not need administrator rights.
- An install directory (free to choose), with or without restricted user permissions. In case of restricted user permissions (e.g. sometimes c:\program files\dakosoftware is blocked), the administrator will have to perform the updates. In case of a non-restricted directory (e.g. d:\dakosoftware) the user can perform updates himself.

## Install procedure

The installer will first check if excel is running. If so, the following red screen displays. Close excel and press any key to continue. Do not close this screen without closing excel since it might result in an improper installation.

During the procedure you can choose an install directory. The installer will copy all necessary files and register two dlls.

You can leave Excel macro security level on “high” or “very high”.

The software uses the registry (HKEY\_CURRENT\_USER\Software\Dakosoftware) to save serial number, code, name, etc.

Please read the quickstart guide (opens automatically after installation) for instructions after installation. The user will be prompted the first time to input serial number and code (must be done under the end user’s account).

To uninstall the software or to access the quickstart guide please point to Start → All programs → Dakosoftware
